Mimo FlashCast for Systems Integrators

Add value to your installations by ensuring visual alerts hit every screen

Your Customers Already Have Screens and Security Systems, but Have You Closed the Loop?

Now, you can turn **ANY** display into a real-time visual alert network. Mimo FlashCast is a simple, scalable hardware and cloud-managed solution that overlays emergency and everyday alerts on HDMI-enabled devices. **The display continues operating normally, and alerts appear only when triggered so existing content and workflows remain uninterrupted**.

Expand Your Safety Offering

FlashCast makes it easy to extend safety messaging to screens that are already deployed. Integrators can **enhance safety proposals, support compliance initiatives, and increase the value of every AV or security deployment** without requiring customers to replace existing infrastructure. Rather than compete with established safety ecosystems, FlashCast enhances them by extending visual alerts to digital signage, TVs, projectors, smartboards, and unused or "dark" displays.

FlashCast allows facilities to communicate clear, specific instructions like "West Entrance Closed" to any screen in real time.

You're not asking customers to rip and replace; you're helping them **maximize what they already own**. Mimo FlashCast is an ideal add-on to:

- Security system upgrades
- Access control projects
- Digital signage deployments
- Campus-wide AV rollouts
- Public address system integrations

"Adding Mimo FlashCast to our InformaCast integrations will give organizations the ability to extend critical messages to screens that previously had no alerting capabilities."
- David Tucker, senior vice-president of product management at Singlewire Software

Differentiate Your Proposal with Visual Alerts

Alarms make noise. Visual alerts provide direction. With increasing regulatory pressure such as **Alyssa's Law and Martyn's Law**, organizations are looking for more comprehensive notification strategies.

Elevate your proposal from basic compliance to proactive risk mitigation. For school districts and campuses with limited IT bandwidth, this **simplicity becomes a major selling point**.
